

## What's New in the Track PO Fulfillment Template App 2102 Micro Release

In the 2102 Micro Release, some non-feature enhancements are delivered as below:

### 1. Change modeling for one-to-many association

To improve the performance of document flow and search by shipment, modeling for one-to-many association in **purchase order – purchase order items**, **purchase order item – delivery items**, **delivery – delivery items** is changed. You need to change the model and related tracked process extractor and adapt to the new read service API in the application code accordingly.

*Example of one-to-many association modeling in Purchase Order and Purchase Order Items*

2. Add actual technical timestamp and actual technical time zone for all AOT and event extractors to minimize IDOC sequencing issues.

3. **[Mandatory for VP integration]** Add *LBN#* as the prefix for Service Agent LBN ID for the shipment extractor.
4. **[Mandatory for receiving actual events from data contributors]** Grant report and read authorization to Service Agent LBN ID in the shipment and resource process type of the model 'Purchase Order Fulfillment'.

The screenshot shows the SAP Model Details interface for the model 'pof'. The 'Tracked Process' tab is active, displaying a list of tracked processes on the left and a list of fields on the right. The 'Shipment' and 'Resource' processes are highlighted with red boxes. The 'Edit Field' dialog is open, showing the configuration for the 'serviceAgentLbnId' field. The dialog includes fields for Name, Label, Type, Length, DPP, Grant, Writable, and Readable. The 'Grant' field is highlighted with a red box, showing 'Read' and 'Report' permissions selected.
