2.4.7 Maintain Roles and Users .....	28
2.4.8 Open <i>Track Shipments</i> Template App from SAP Fiori Launchpad .....	28
3. Implement ERP Extractor .....	29
4. Other Configuration .....	30
4.1 Obtain Here Map License.....	30
4.2 Maintain Location Master .....	30
4.3 Maintain Data Contributors .....	31
4.4 Integrate with Visibility Provider .....	31

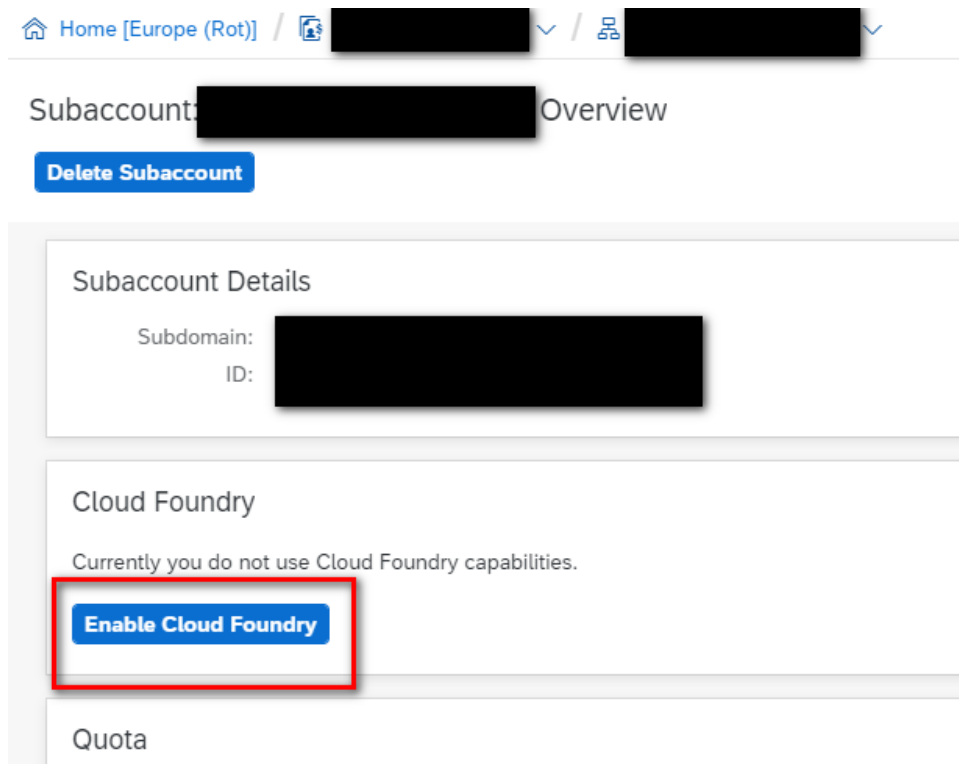

## 0.Prerequisites

- You have an SAP Cloud Platform global account with the entitlement to the global track and trace option for SAP Logistics Business Network, and the account is assigned 1 portal service quota and 2 GB Application Runtime quota.  
Please refer to the 1<sup>st</sup> Q&A in “FAQs for Template Code Implementation” for guidance on how to add quotas.

## 1.Environment Configuration in Logistics Business Network, Global Track and Trace Option

### 1.1 Enable Cloud Foundry and Create Space

- Click “Enable Cloud Foundry” to enable the development landscape

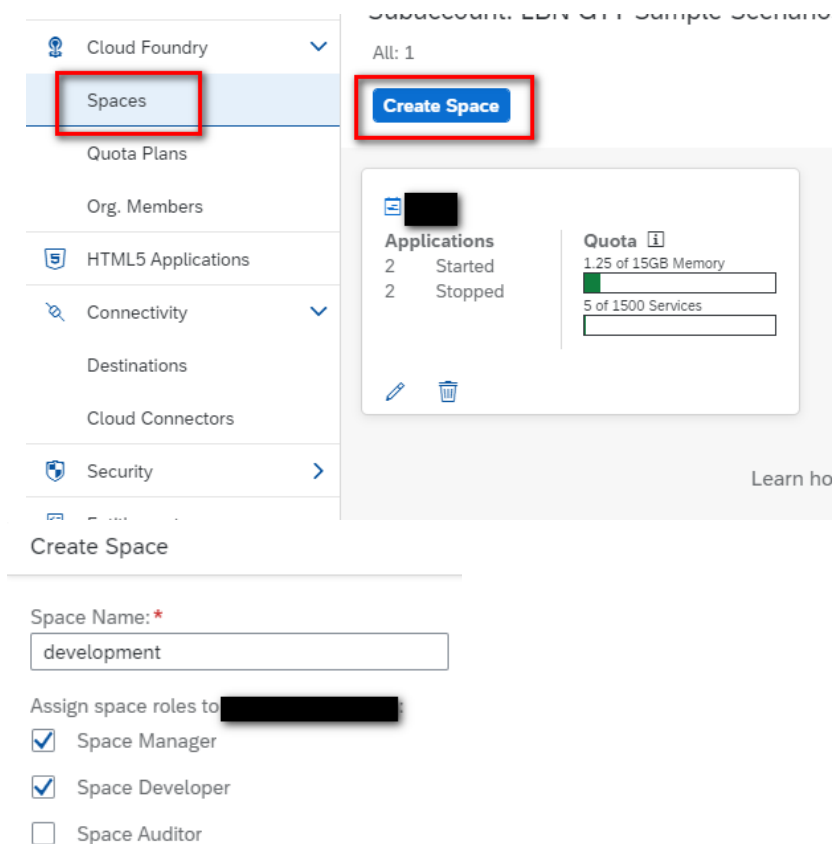

- b. Fill in the Organization Name and click “Create”

The image shows a dialog box titled "Create Cloud Foundry Organization". It has a text input field for "Organization Name" with a red asterisk indicating it is required. The text "GTT\_APPS" is entered into the field. At the bottom right, there are two buttons: "Create" and "Cancel".

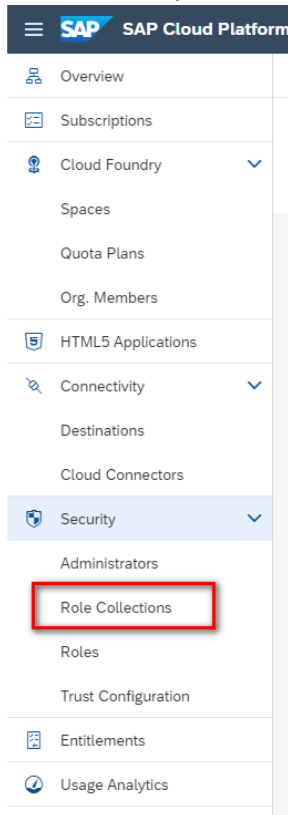

- c. Go to “Cloud Foundry” -> “Spaces”  
Click “Create Space”  
Fill in the Space Name and click “Create”

The image shows the Cloud Foundry Spaces management interface. On the left is a sidebar with a menu containing "Cloud Foundry", "Spaces", "Quota Plans", "Org. Members", "HTML5 Applications", "Connectivity", "Destinations", "Cloud Connectors", "Security", and "Learn how". The "Spaces" item is highlighted with a red box. In the main content area, there is a "Create Space" button, also highlighted with a red box. Below this, a card displays details for a space named "development". The card shows a table of applications with 2 started and 2 stopped. It also shows a quota of 1.25 of 15GB Memory and 5 of 1500 Services. At the bottom, there is a section titled "Create Space" with a "Space Name" field containing "development". Below this, there is a section "Assign space roles to" with a dropdown menu showing a user. Three roles are listed: "Space Manager" (checked), "Space Developer" (checked), and "Space Auditor" (unchecked).

## 1.2 Maintain Roles and Users

1. Go to “Security” -> “Role Collections”

2. Create 2 role collections (You can have user-defined names):

gtt-sample-all

gtt-sample-integration

- Role template “gtt-sample-all” is granted to users who have access to global track and trace option and *Track Shipments* template app.
- Role template “gtt-sample-integration” is granted to technical users only who have access to the global track and trace APIs for development purpose.

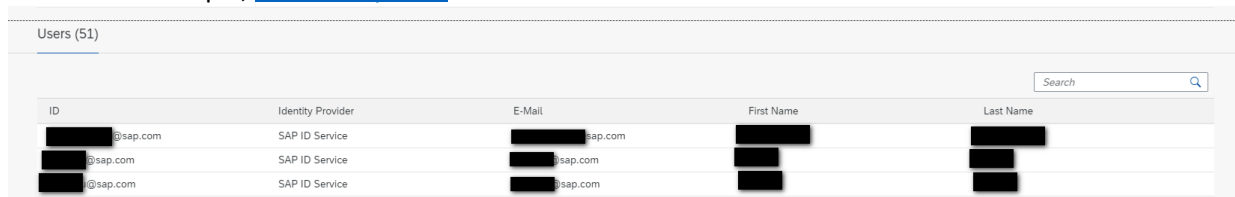

3. Go to the role of “gtt-sample-all”, and add the following roles:

Role	Application
MessageLogAdminTemplate	lbn_gtt_core
DataModelAdminTemplate	lbn_gtt_core
LocationProcessTemplate	lbnplatform-loc-broker
BPEditTemplate	lbnplatform-bprepo
BusinessPartnerDiscoveryTemplate	lbnplatform-bprepo
InviteBPPProcessTemplate	lbnplatform-bprepo
ManageInvitationsProcessTemplate	lbnplatform-bprepo
BlockStoreProcessTemplate	lbn-retentionmanagement-sb
ReminderTemplateProcessTemplate	lbn-retentionmanagement-sb

4. Grant "gtt-sample-all" to your **application** users:
- Application users are those who have access to global track and trace option and *Track Shipments* template app.

IT Administrator needs to maintain application users in identity provider.

For example, [user1@sap.com](mailto:user1@sap.com)

The screenshot shows the 'Users (51)' page in SAP Identity Management. It features a search bar at the top right. Below is a table with columns: ID, Identity Provider, E-Mail, First Name, and Last Name. The first three rows of data are visible, all showing users from the 'SAP ID Service' identity provider with email addresses ending in '@sap.com'.

ID	Identity Provider	E-Mail	First Name	Last Name
[REDACTED]	SAP ID Service	[REDACTED]@sap.com	[REDACTED]	[REDACTED]
[REDACTED]	SAP ID Service	[REDACTED]@sap.com	[REDACTED]	[REDACTED]
[REDACTED]	SAP ID Service	[REDACTED]@sap.com	[REDACTED]	[REDACTED]

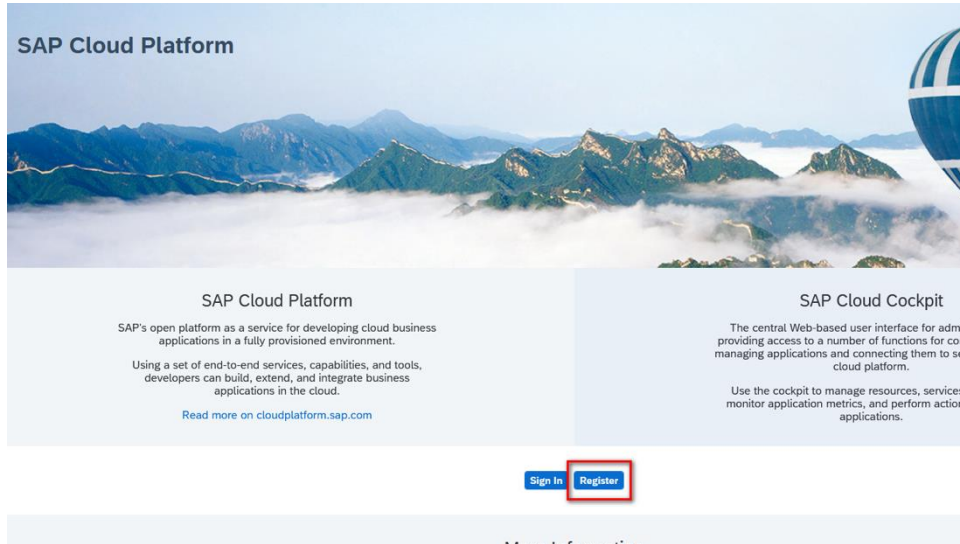

Note: The application user in this step should be different from the technical user created in Step 1.3. A user should **never** be assigned to **both** “gtt-sample-all” and “gtt-sample-integration”.

### 1.3 Maintain Technical User

- a. Go to the SAP Cloud Platform to create the technical user account:

<https://account.hana.ondemand.com/#/home/welcome>

Click “Register”

- b. Fill in the mandatory fields:

Tell us about yourself

E-mail address *	First name *
Last name *	Company *
Country/Region United States	Phone +1 XXX-XXX-XXXX
Department *	Relationship to SAP *
Create password *	Confirm password *

Must have at least 8 characters.

☐ I have read and understood the Terms and Conditions of [SAP.com](#)

SAP will use any of the data provided hereunder in accordance with the [Privacy Statement](#).

This site is protected by reCAPTCHA and the Google [Privacy Policy](#) and [Terms of Service](#) apply.

- c. Go to the mail inbox to activate the account

- d. As shown in Step 1.2, go to the role of “gtt-sample-integration”, and add the following roles:

Role	Application
EMIDocIntegrationTemplate	lbn_gtt_core
MetadataServiceIntegrationTemplate	lbn_gtt_core
ReadServiceIntegrationTemplate	lbn_gtt_core
WriteServiceIntegrationTemplate	lbn_gtt_core
LocationProcessTemplate	lbnplatform-loc-broker

- e. Grant “gtt-sample-integration” to your **technical** user:

For example, [techuser1@techcompany.com](mailto:techuser1@techcompany.com)

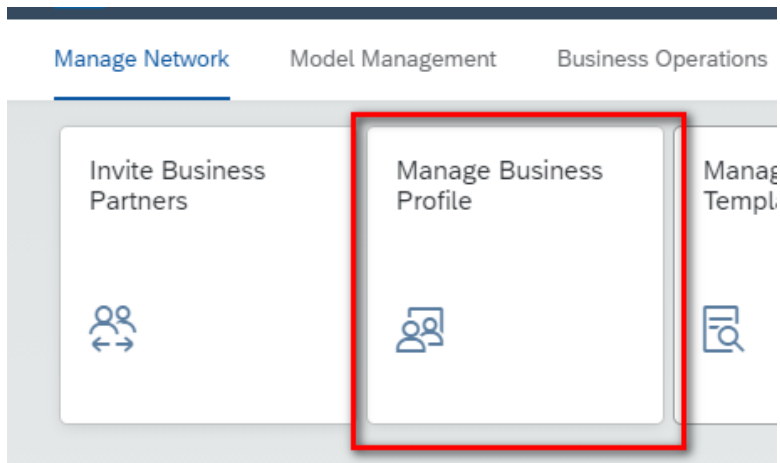

Users (2)

ID	Identity Provider	E-Mail
<input type="text" value="techuser1@techcompany.com"/>	<input type="text" value="Default identity provider"/>	<input type="text" value="techuser1@techcompany.com"/>

Note:

In the “Identity Provider” field, select “Default identity provider”.

- f. Go to SAP Fiori Launchpad for global track and trace option  
Open *Manage Business Profile* app

- g. Add one Alternate Identifier:  
Identifier Type: Technical User  
ID: the email address of technical user

Email	Phone Number
[REDACTED]	[REDACTED]

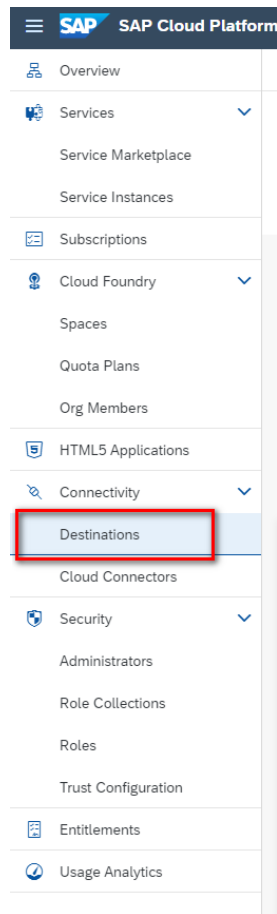

Alternate Identifiers (1)	
Identifier Type	ID
Technical User	[REDACTED].com

Note: The technical user in this step should be different from the application user in Step 1.2.4. A user should **never** be assigned to **both** “gtt-sample-all” and “gtt-sample-integration”.

## 1.4 Maintain Destination of GTT Core Engine Base URL

- Go to “Destinations”

- Configure Destination of GTT Core Engine Base URL

Name	gtt_core_engine_flp_base_url
Type	HTTP
Description	<optional>
URL	Input the GTT Fiori Launchpad URL and add “/api” at the end of it For example: <a href="https://xxxxx.gtt-flp-lbnplatform.cfapps.eu10.hana.ondemand.com/api">https://xxxxx.gtt-flp-lbnplatform.cfapps.eu10.hana.ondemand.com/api</a> For the instructions on how to get the GTT Fiori Launchpad URL, see the note under this table
Proxy Type	Internet
Authentication	BasicAuthentication
User	Email of Technical User from Step 1.3
Password	Password of Technical User from Step 1.3

Note:

- On your subaccount page, click “Instances and Subscriptions” in the “Service” tab and click “Global Track and Trace Option” application. Click “Go to Application”.

The screenshot displays the SAP Service Marketplace interface. On the left, a navigation menu includes 'Overview', 'Services', 'Service Marketplace', 'Cloud Foundry', 'Spaces', 'Quota Plans', 'Org Members', 'HTML5 Applications', 'Connectivity', 'Destinations', 'Cloud Connectors', and 'Security'. The 'Instances and Subscriptions' link under 'Service Marketplace' is highlighted with a red box. The main content area shows the 'Subscriptions (6)' for a specific subaccount. A table lists the subscribed applications, with 'Global Track and Trace Option' highlighted and its name also boxed in red. To the right, the details for 'Global Track and Trace Option, Solution Owner' are shown, including a 'Go to Application' button (also boxed in red) and a 'Documentation' link.

Application	Status
[Redacted]	Subscribed
[Redacted]	Subscribed
[Redacted]	Subscribed
[Redacted]	Subscribed
Global Track and Trace Option	Subscribed
[Redacted]	Subscribed

Copy the GTT Fiori Launchpad URL:

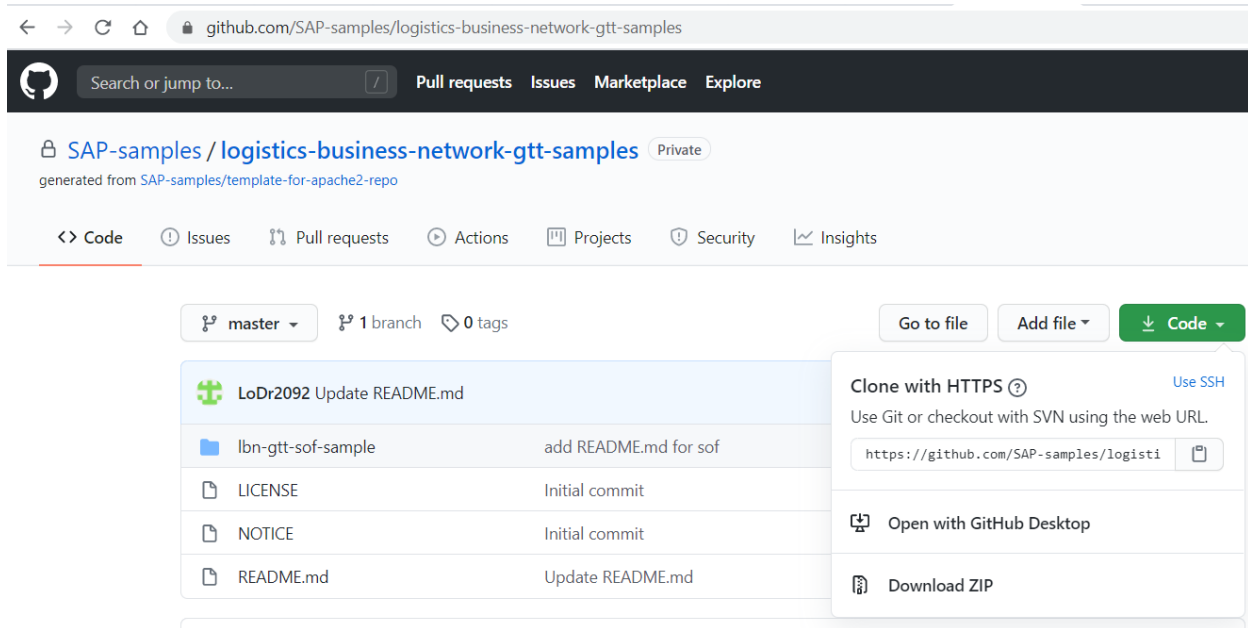

[https://\[Redacted\]gtt-flp-lbnplatform.cfapps.eu10.hana.ondemand.com/cp.portal/site#Shell-home](https://[Redacted]gtt-flp-lbnplatform.cfapps.eu10.hana.ondemand.com/cp.portal/site#Shell-home)

## 2. Implement *Track Shipments* Template App

### 2.1 Download Template Code

Go to <https://github.com/SAP-samples/logistics-business-network-gtt-samples>.

Download and extract, or git clone the template code from SAP-samples on GitHub.

### 2.2 Download and Setup Tools

#### a. Install JDK 8 and Maven

JDK 8: <https://www.oracle.com/java/technologies/javase/javase-jdk8-downloads.html>

Maven: <https://maven.apache.org/download.cgi>

#### b. Install NPM, Node JS, and grunt-cli

Node JS 12: <https://nodejs.org/dist/latest-v12.x/>

[For the instructions on how to install Node JS and NOM, see https://www.saplearners.com/how-to-install-node-js-and-npm/](https://www.saplearners.com/how-to-install-node-js-and-npm/)

Run the following command after NPM is installed:  
`npm config set @sap:registry "https://npm.sap.com" -g`

#### c. Install Cloud Foundry Command Line Interface

<https://developers.sap.com/tutorials/cp-cf-download-cli.html>

#### d. Install MultiApps CF CLI Plugin

<https://github.com/cloudfoundry-incubator/multiapps-cli-plugin>

#### e. Install Cloud MTA Build Tool (MBT)

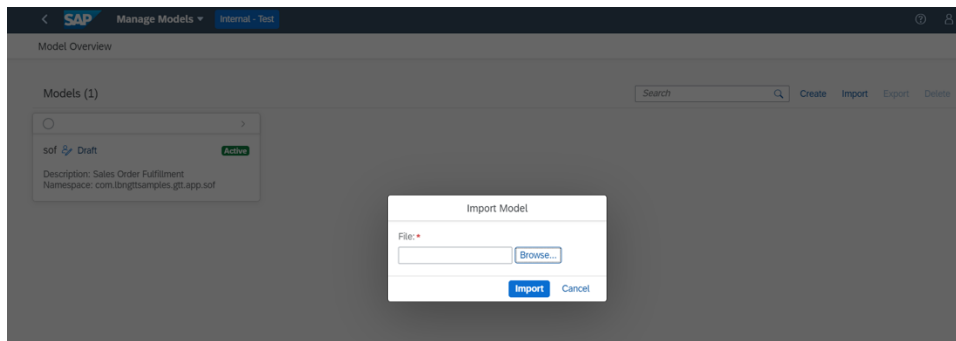

<https://sap.github.io/cloud-mta-build-tool/download/>

f. Install MAKE

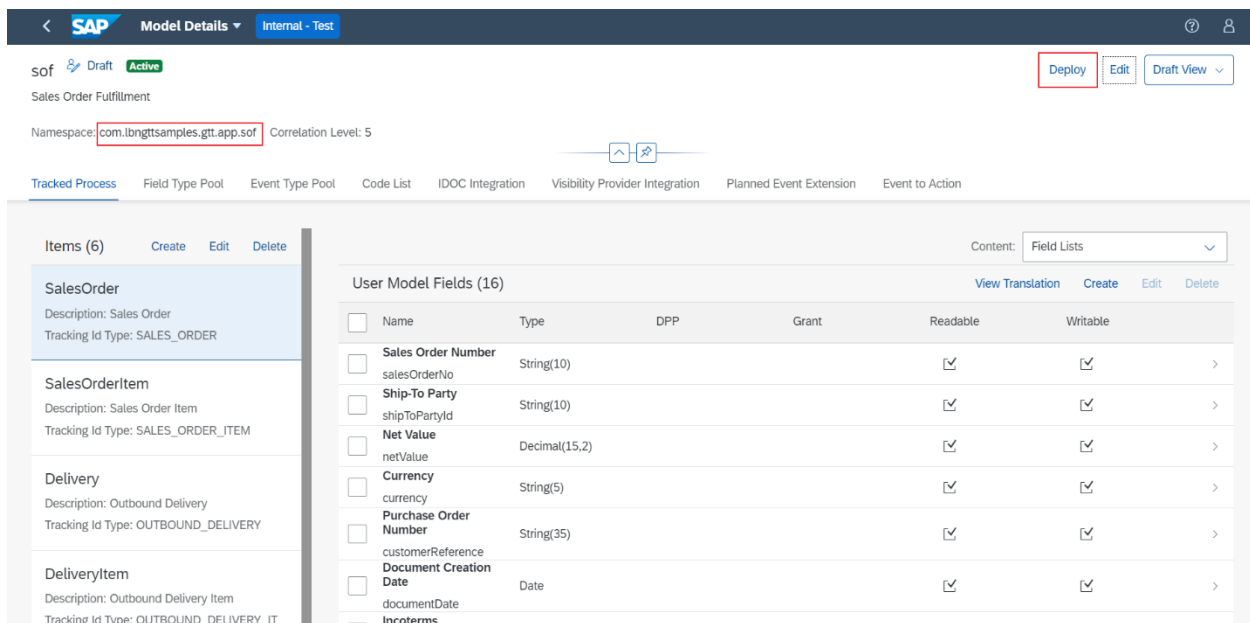

<https://sap.github.io/cloud-mta-build-tool/makefile/>

## 2.3 Deploy Model

- Go to the folder *model* with downloaded source code. Make sure you have a JSON file *sof-model-YYYYMMDDxx.json* (e.g. *sof-model-2020091001.json*).
- Open *Manage Models* app on SAP Fiori Launchpad for global track and trace option
- Click “Import”
- Click “Browse” to select the *sof-model-YYYYMMDDxx.json* file
- Click “Import” to import the model

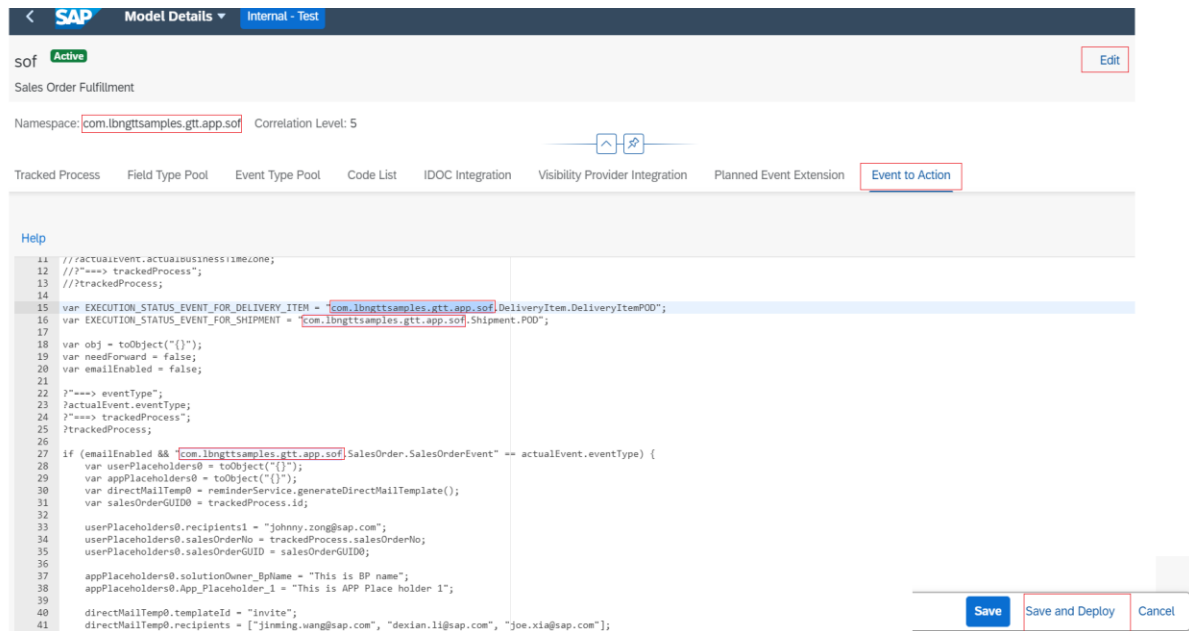

- Click “Deploy”
- Write down the model namespace for later use, in this case, “com.lbgnttsamples.gtt.app.sof” in the picture below

- Click “Edit”

- Go to *Event to Action* tab
- Replace all the namespace strings, in this case, “com.lbngttsamples.gtt.app.sof” in *Event to Action* script with the model namespace you wrote down in the previous step
- Click “Save and Deploy” to deploy the model

## 2.4 Package and Deploy

### 2.4.1 Login to SAP Cloud Foundry

- Open a command window, *cf login* to SAP Cloud Foundry with your username and password
- Select the organization and space in which you want to deploy the template apps

```
MINGW64: [redacted]
Authenticating...
OK
Select an org:
1. [redacted]
2. [redacted]
3. [redacted]
4. [redacted]
5. [redacted]
6. [redacted]

Org (enter to skip): 6
6
Targeted org [redacted]

Select a space:
1. acc
2. perf
3. int
4. inthf
5. sbx

Space (enter to skip): 5
5
Targeted space [redacted]

API endpoint: https://api.cf.sap.hana.ondemand.com (API version: 3.81.0)
User: [redacted]
Org: [redacted]
Space: [redacted]
```

## 2.4.2 Package and Deploy *Track Shipments* Frontend App

Go to GTT-V2-Sample-TrackShipments-UI directory.

- Open the `./UI/.env` file
- Replace `{tenant-name}` with the middle part of the namespace you got from Step 2.3.

The screenshot shows the SAP Fiori Tools interface for configuring a tracked process. The namespace `com.lnngttsamples.gtt.app.sof` is highlighted with a red box. A red arrow points from this box to a Notepad window showing the `.env` file content, where `{tenant-name}` is also highlighted with a red box.

sof Active Edit Deploy

Sales Order Fulfillment

Namespace: `com.lnngttsamples.gtt.app.sof` Correlation Level: 5 Model Category: User Defined

Tracked Process Field Type Pool Event Type

Items (7) Create Edit

env - Notepad

File Edit Format View Help

TENANT\_NAME={tenant-name}

UI5\_URL=http://localhost:5000/sapui5

UI5\_DIR=C:\Dev\SAPUI5\1.78.3

In the command line tool,

- Run the following command to build the MTAR package:  
`mbt build`

A MTAR file `./mta_archives/gtt-v2-ui-sample-track-shipments_xxx.mtar` is then generated.

- To deploy the MTAR package in Cloud Foundry, run the following command:  
`cf deploy ./mta_archives/gtt-v2-ui-sample-track-shipments_xxx.mtar`

The deployment time depends on your network conditions.

### 2.4.3 Package and Deploy SAP Fiori Launchpad for *Template Applications*

Go to GTT-V2-Sample-App-FLP directory.

- First ensure that at least 1 portal quota is assigned to the subaccount in which apps are deployed.  
You can refer to the 1<sup>st</sup> Q&A in *FAQs for Template Code Implementation* for guidance on how to add quotas.
- Open the *mta.yaml* file
- Replace {unique-identifier} with unique information such as your company name or cloud foundry global account name

Note:

- {unique-identifier} must only contain lowercase letters, numbers and hyphens "-". For example, "company-s01".
- For the length of "routes", the maximum limit is 63 characters.

```
1  ---
2  ID: lbn-gtt-sample-app-flp
3  _schema-version: "3.1"
4  parameters:
5    deploy_mode: html5-repo
6    enable-parallel-deployments: true
7    append: "${space}"
8    xsappname: tt_sof_${append}
9  version: 2.3.0
10 modules:
11   - name: lbn-gtt-sample-app-appRouter
12     type: approuter.nodejs
13     path: flp_appRouter
14     parameters:
15       disk-quota: 256M
16       memory: 256M
17       routes:
18         - route: lbn-gtt-samples-app-flp-{unique-identifier} ${domain}
19   properties:
20     SAP_JWT_TRUST_ACL:
21       - clientid: "*"
22       identityzone: "*"
23   destinations:

121                     "salesOrder",
122                     "shipment",
123                     "purchaseOrder"
124                 ],

```

In the command line tool,

- Run the following command to build the MTAR package:

```
mbt build
```

A MTAR file `./mta_archives/lbn-gtt-sample-app-flp_xxx.mtar` is then generated.

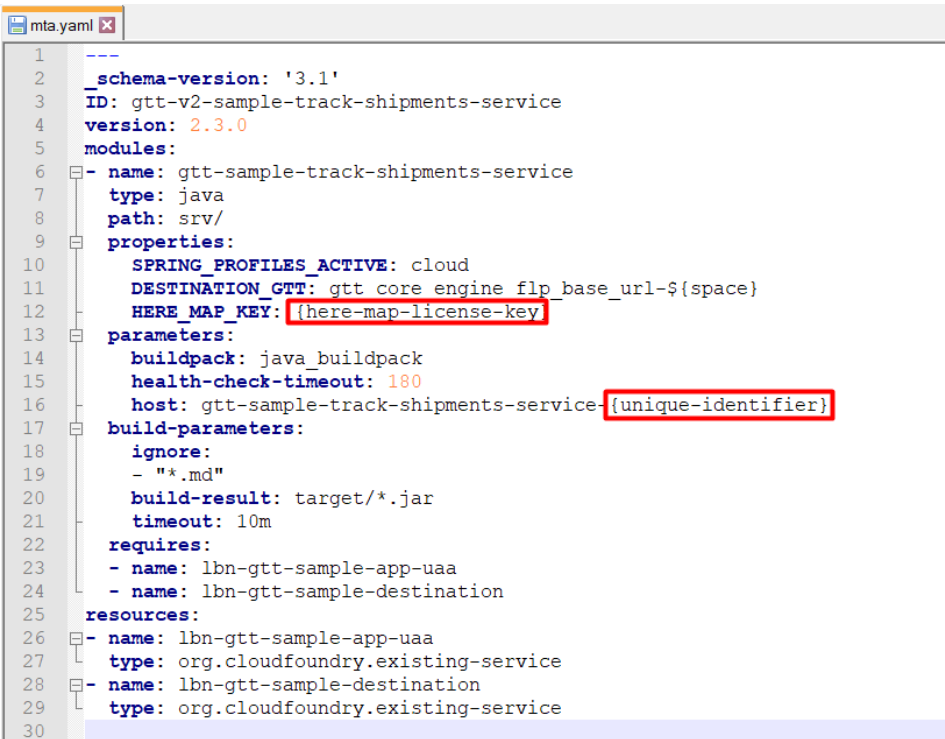

- Deploy the MTAR package in Cloud Foundry by running the following command:

```
cf deploy ./mta_archives/lbn-gtt-sample-app-flp_xxx.mtar
```

## 2.4.4 Package and Deploy *Track Shipments* Backend Service

*Replace User/Password, Here Map License Key and Host Configuration*

- Open the file `mta.yaml` under the folder “GTT-V2-Sample-TrackShipments-Service”:

```
1  ---
2  _schema-version: '3.1'
3  ID: gtt-v2-sample-track-shipments-service
4  version: 2.3.0
5  modules:
6  - name: gtt-sample-track-shipments-service
7    type: java
8    path: srv/
9    properties:
10     SPRING_PROFILES_ACTIVE: cloud
11     DESTINATION_GTT: gtt core engine flp_base_url-${space}
12     HERE_MAP_KEY: {here-map-license-key}
13    parameters:
14     buildpack: java_buildpack
15     health-check-timeout: 180
16     host: gtt-sample-track-shipments-service-{unique-identifier}
17    build-parameters:
18     ignore:
19     - "*.md"
20     build-result: target/*.jar
21     timeout: 10m
22    requires:
23     - name: lbn-gtt-sample-app-uaa
24     - name: lbn-gtt-sample-destination
25    resources:
26  - name: lbn-gtt-sample-app-uaa
27    type: org.cloudfoundry.existing-service
28  - name: lbn-gtt-sample-destination
29    type: org.cloudfoundry.existing-service
30
```

- Replace `{here-map-license-key}` with the license key you can get from step 4.1.

Note: this step is optional, you could ignore this to proceed to verify if application could be built and pushed successfully. After the actual license key is obtained, you could later come back and replace it and execute this steps again to build and push the application to cloud so that the map could be shown.

- Replace `{unique-identifier}` with the unique information such as your company name or cloud foundry global account name.

Note:

- `{unique-identifier}` must only contain lowercase letters, numbers and hyphens. For example, “company-s01”.
  - For the length of “host”, the maximum limit is 63 characters.
- Open the file `./srv/src/main/java/com/sap/gtt/v2/sample/sst/common/constant/Constants.java`
  - Replace “com.lbngttsamples.gtt.app.sof” with the model namespace you got from Step 2.3

```

1 package com.sap.gtt.v2.sample.sst.common.constant;
2
3 import java.math.BigDecimal;
4
5 public class Constants {
6
7     public static final String GTT_MODEL_NAMESPACE = "com.lbngttsamples.gtt.app.sof";
8     public static final String GTT_MODEL_NAMESPACE_WRITE_SERVICE = GTT_MODEL_NAMESPACE + ".sofWriteService";
9     public static final String MODEL_NAMESPACE = GTT_MODEL_NAMESPACE + ".sofService";
10    public static final String ENTITY_CONTAINER_NAME = "EntityContainer";
11    public static final String COMBINED_MODEL_PATH_SEGMENT = "combined-model";
12    public static final String SHIPMENT_MODEL_NAME = "Shipment";
13    public static final String ELEMENTS_PATH_SEGMENT = "elements";
14    public static final String REST_ROOT_URL = "/sap/logistics/gtt/sample/sst/rest/v1";
15    public static final String ODATA_ROOT_URL = "/sap/logistics/gtt/sample/sst/odata/v1";
16    public static final String DATE_TIME_PATTERN = "yyyy-MM-dd'T'HH:mm:ss'Z'";
17    public static final BigDecimal MAX_LONGITUDE = BigDecimal.valueOf(180);
18    public static final BigDecimal MAX_LATITUDE = BigDecimal.valueOf(90);

```

- Run the following command to build the MTAR package:

```
mbt build
```

A MTAR file `./mta_archives/gtt-v2-sample-track-shipments-service_xxx.mtar` is then generated.

- Deploy the MTAR package in Cloud Foundry by running the following command:

```
cf deploy ./mta_archives/gtt-v2-sample-track-shipments-service_xxx.mtar
```

## 2.4.5 Check Deployed Apps on SAP Cloud Foundry Cockpit

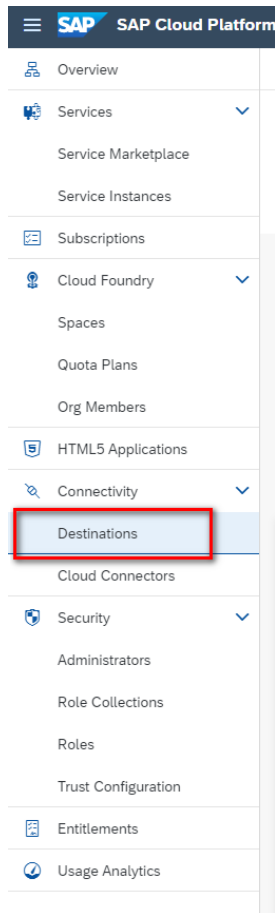

After operations from Step 2.4.1 to Step 2.4.4, check the deployed apps on SAP Cloud Platform Cockpit.

The screenshot shows the SAP Cloud Platform Cockpit interface. The left sidebar contains navigation links for Applications, Services, SAP HANA Cloud, SAP HANA Cloud Migrations, SAP HANA, Portal, Routes, Security Groups, Events, and Members. The main area displays the 'Space: [redacted] Applications' with a 'Deploy Application' button. Below this is a table of deployed applications.

Requested State	Name	Instances	Disk Quota
Stopped	flp-blue	0/1	1024 MB
Started	gtt-sample-track-purchaseorders-service-green	1/1	1024 MB
Started	gtt-sample-track-salesorders-service-blue	1/1	1024 MB
Started	gtt-sample-track-shipments-service-green	1/1	1024 MB

## 2.4.6 Maintain Destination of Forwarding

### a. Go to “Destinations”

## b. Configure Destination of Event to Action

Refer to Chapter 3 of the document *03\_Synchronize\_Actual\_Events\_To\_TM-TS.pdf*

Note:

Replace "TO\_QW9\_170\_STANDARD" with the destination name that you maintained in Step 2 and replace "QW9CLNT170" with the logical system of shipment tracked process.

Help

```
368 /*-----Forward to TM system begin-----*/
369 //For Track Shipments Application Only
370 var destinationTMName = "TO_QW9_170_STANDARD";
371 var msgObj = toObject("{}");
372 var eventObj = toObject("{}");
373
374 var reportedBy = null;
375 var estimatedArrivalTime = null;
376 var refPlannedEventMatchKey = null;
377 var estimatedArrival = null;
378
379 eventObj.eventReasonCode = "";
380 eventObj.stopId = "";
381
382 if (trackedProcess != null &&
383     "QW9CLNT170" == trackedProcess.logicalSystem &&
384     "SHIPMENT_ORDER" == actualEvent.trackingIdType &&
385     ("com.lbngttsamples.gtt.app.sof.Shipment.Departure" == actualEvent.eventType ||
386      "com.lbngttsamples.gtt.app.sof.Shipment.Arrival" == actualEvent.eventType ||
387      "com.lbngttsamples.gtt.app.sof.Shipment.Delay" == actualEvent.eventType ||
388      "com.lbngttsamples.gtt.app.sof.Shipment.LoadingStart" == actualEvent.eventType ||
389      "com.lbngttsamples.gtt.app.sof.Shipment.LoadingEnd" == actualEvent.eventType ||
390      "com.lbngttsamples.gtt.app.sof.Shipment.POD" == actualEvent.eventType ||
391      "com.lbngttsamples.gtt.app.sof.Shipment.POPU" == actualEvent.eventType ||
392      "com.lbngttsamples.gtt.app.sof.Shipment.Coupling" == actualEvent.eventType ||
393      "com.lbngttsamples.gtt.app.sof.Shipment.Decoupling" == actualEvent.eventType ||
394      "com.lbngttsamples.gtt.app.sof.Shipment.UnloadingStart" == actualEvent.eventType ||
395      "com.lbngttsamples.gtt.app.sof.Shipment.UnloadingEnd" == actualEvent.eventType)) {
396     if (actualEvent.containsProperty("estimatedArrival") && actualEvent.containsProperty("refPlannedEventMatchKey")) {
397         refPlannedEventMatchKey = actualEvent.refPlannedEventMatchKey;
398         estimatedArrival = actualEvent.estimatedArrival;
399         var i = 0;
400         // Get the latest matched estimatedArrivalTime
```

## 2.4.7 Maintain Roles and Users

As shown in Step 1.2, go to the role of “gtt-sample-all”, and add the following role:

Role	Application
StandaloneShipmentTrackingAppUserDisplayTemplate	tt_sof_{space}
StandaloneShipmentTrackingAppUserProcessTemplate	tt_sof_{space}

Note:

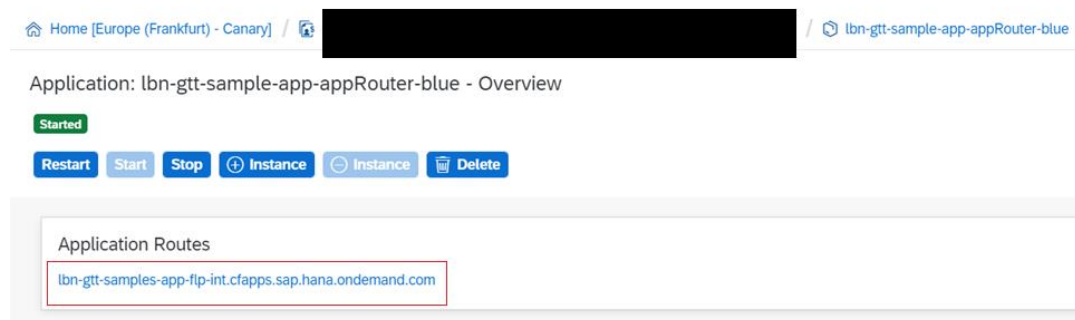

- The role “StandaloneShipmentTrackingAppUserDisplayTemplate” can only enable the user to view the Track Shipments app.
- The role “StandaloneShipmentTrackingAppUserProcessTemplate” can only enable the user to report events in Track Shipments app. If the user needs the access to view both the Track Shipments app and report events in the app, then assign both roles to the role template.

If the user needs the access to other template apps such as *Track SO Fulfillment* or *Track PO Fulfillment*, add the following roles:

Role	Application
SalesOrderFulfillmentAppUserDisplayTemplate	tt_sof_{space}
PurchaseOrderFulfillmentAppUserDisplayTemplate	tt_sof_{space}

## 2.4.8 Open *Track Shipments* Template App from SAP Fiori Launchpad

- Obtain the Application Routes from SAP Cloud Foundry Cockpit

- Click the link of Application Routes  
The system browser then navigates to the SAP Fiori Launchpad of *Track Shipments*

- Open the *Track Shipments* template app

The screenshot shows the SAP 'Track Shipments' app interface. At the top, there's a header with 'SAP' and 'Track Shipments'. Below the header, there's a 'Standard' filter section with various input fields for filtering shipments. Below the filters, there's a table titled 'Shipments (295)' showing a list of shipments with columns for Shipment Number, Carrier, Planned Departure, Planned Arrival, Execution Status, and Process Status.

Shipment Number	Carrier	Planned Departure	Planned Arrival	Execution Status	Process Status
6100062252		MEB_CUS_46 Oct 31, 2018, 5:12:00 PM	Golden Nuts Inc.	Not Started	Overdue
4150002217	10000043	The Cookie Company Shp. Point Feb 2, 2999, 7:00:00 AM	Walmart Inc. Feb 2, 2999, 5:00:00 PM	Not Started	As Planned
0000001671	10002419	Golden Nuts Inc.	US HARBOR Dec 20, 2020, 7:00:00 PM	In Transit	Overdue
000000265X	10002418	New York Harbor Dec 11, 2020, 7:00:00 AM	Golden Nuts Inc. Dec 12, 2020, 7:00:00 AM	In Transit	As Planned
0000002643	10002419	New York Harbor Dec 17, 2020, 7:00:00 AM	Golden Nuts Inc. Dec 18, 2020, 7:00:00 AM	In Transit	Early

### 3. Implement ERP Extractor

For ERP extractor implementation, please refer to the following document:

*04\_Extractor\_Creation\_Guide-TS.pdf*

## 4. Other Configuration

### 4.1 Obtain Here Map License

To have the map view, log the incident with the URL of Fiori Launchpad of template apps in SAP support system under component “SCM-LBN-GTT-APP”. Follow the 2 steps below when you create an incident:

- 1) Add logon credentials in the incident to the secure area so that we can provide you the key in a safe way. You can refer to SAP Note 1773689 for reference:  
<https://launchpad.support.sap.com/#/notes/0001773689>
- 2) Provide us with the application routes which you get in step 2.4.8 “Obtain the Application Routes from SAP Cloud Foundry Cockpit”

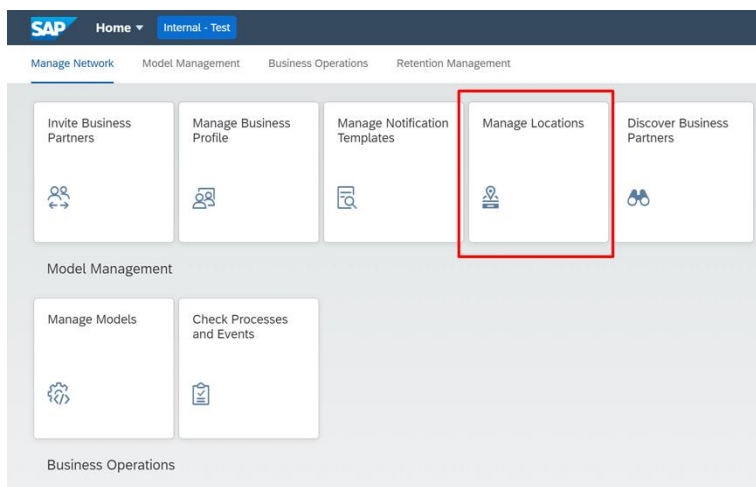

After you get the key, you can use it in Step 2.4.4 to re-deploy the backend service.

For quick validation, you can also use the tile service of other map services.

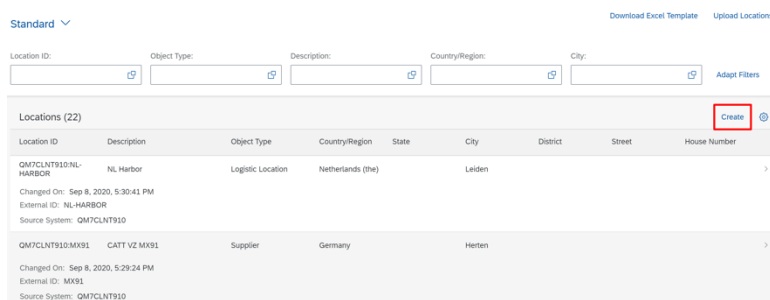

### 4.2 Maintain Location Master

To show stops and planned events in the map, you need to maintain location master data with valid geocoordinates in *Manage Locations* app.

- a. Open *Manage Locations* app in your SAP Fiori Launchpad for global track and trace option

- b. Click “Create” to create a new location

c. Maintain location information with valid geocoordinates

To integrate with ERP, you need to keep the “Object Type”, “Source System”, and “External ID” location consistent with ERP location information.

For details, please refer to the following document:

*02\_Extractor\_Creation\_Guide-SOF.pdf*

SAP Manage Locations Internal - Test

Create Location

GENERAL ALTERNATIVE LOCATION IDS

Object Type: \*  
Logistic Location

Source System/External ID: \*  
Source System External ID

Description: \*

Time Zone:

Country/Region:

State:

City:

District:

Street/House Number:

Zip Code:

Longitude: \*  
° (East) Example: 000.00000000

Latitude: \*  
° (North) Example: 00.00000000

#### 4.3 Maintain Data Contributors

To receive actual events from other business partners, you need to invite them to join your business network. For more, search for *Administration Guide for Version 2* at [help.sap.com/gtt](https://help.sap.com/gtt) and see the chapter “Onboarding and User Management (Data Contributors)”.

#### 4.4 Integrate with Visibility Provider

To integrate with visibility provider, log your incident in SAP BCP system with the component “SCM-LBN-GTT-COR”.
