**What's New in the Track SO Fulfillment Template App 2102 Micro Release**

In the 2012 Micro Release, some non-feature enhancements are delivered as below:

1. Change modeling for one-to-many association
   To improve the performance of document flow and search by shipment, modeling for one-to-many association in **sales order – sales order items**, **sales order item – delivery items, delivery – delivery items** is changed. You need to change the model and related tracked process extractor and adpat to the new read service API in the application code accordingly.

Example of one-to-many association modeling in Sales Order and Sales Order Items

2. Add actual technical timestamp and actual technical time zone for all AOT and events.
3. **[Mandatory for VP integration]** Add *LBN#* as the prefix for Service Agent ID for the shipment extractor.
4. **[Mandatory for receiving actual events from data contributors]** Grant report and read authorization to Service Agent ID in the shipment model.
